SUMMARY

Full-stack engineer with 4+ years shipping production React and Next.js apps in TypeScript. As founding engineer on an AI platform, architected browser-based app execution on WebContainers, making core calls on tech with no established playbook. Earlier led a dual-control wire authorization module end-to-end on a FedWire-certified platfor

SKILLS

- **Frontend:** React.js, Next.js (App Router, RSC), TypeScript, JavaScript (ES6+), Redux, Context API, Tailwind CSS, shadcn/ui, HTML, CSS
- **Backend:** Node.js, Express, PostgreSQL, REST APIs, OAuth, JWT, Java, System design, Microservices
- **Testing:** Jest, React Testing Library, Cypress, Playwright
- **Build & Deploy:** Webpack, Docker, CI/CD (Jenkins), Git, AWS, GCP, Agile
- **AI Engineering:** Multi-agent orchestration, LLM tooling, RAG, Prompt Engineering, Event streaming

WORK EXPERIENCE

KINDGI | Founding Engineer | *Remote | Ontario* Dec 2024 – Present

- Architected the frontend from zero for an AI platform that turns natural language into deployable full-stack apps and autonomous AI agents with human-in-the-loop approval gating high-stakes actions.
- Cut app-generation time 67% (15 → 5 min) by building a browser-based code-execution pipeline on WebContainers that scaffolds, runs, and live-previews generated apps client-side, eliminating backend roundtrips.
- Extended generation to full deployment: schemas via Drizzle, backend APIs with Hono, and one-click deploys to Cloudflare Workers.
- Built a no-code agent builder letting non-technical users wire integrations, memory/context, and multi-step tool-calling in natural language, with real-time run streaming and agent run-state over SSE with optimistic UI.
- Stack: Next.js, React, TypeScript, Node.js, Vercel AI SDK, WebContainers, PostgreSQL, Cloudflare, Trigger.dev

PATHFINDER GROUP LTD | Software Developer | *Remote | US* May 2023 – Dec 2024

- WITS: a FedWire-certified wire transfer platform used by financial institutions for real-time, compliant wire processing.
- Built the Signers authorization module end-to-end modeling approval thresholds, role hierarchies, and dual-control state transitions across the React client and its API contract with backend Java services.
- Refactored the wire-transfer platform's Redux layer splitting overlapping reducers, normalizing duplicated and nested state, and adding memoized selectors to cut unnecessary re-renders on high-traffic transfer screens.
- Cut API calls 60% and reduced page load times ~5s by optimizing data fetching, caching, and Core Web Vitals.
- Redesigned core wire-transfer screens, resolved production incidents, and shipped a new report type into the platform's jsreport reporting pipeline coordinating with backend Java services through Jenkins CI/CD.
- Stack: React, Redux, TypeScript, JavaScript, Java, JSReport, SCSS, Jenkins, Gitlab, Docker

NOKA SOFTWARE AND CREATIVE INC. | Frontend Developer | *Remote | Ontario* May 2022 – Apr 2023

- Built React and TypeScript features across a B2B contract-management platform's creation and lifecycle flows.
- Built end-to-end integration coverage with Cypress and Playwright, catching regressions before release.

REPLICANT.AI | Software Engineering Intern | *Remote | US* May 2021 – Aug 2021

- Boosted input-interpretation accuracy from 40% to 70% by designing fuzzy-matching algorithms that interpreted live customer voice and mapped it to a finite intent set driving a state-machine dialogue flow.
- Wrote test suites and evaluated intent-matching performance, diagnosing, and fixing the failure cases that drove those accuracy gains.

EDUCATION

Laurentian University | Sudbury, ON, Canada May 2019 – Apr 2023
Bachelor of Computer Science (Honours) **GPA: 8.9 / 10**

PROJECTS

Real-Time Collaborative Home Hub
Distributed multi-user app for household notes, todos, and bill management — synced live across devices.

- Architected a real-time multi-client application with WebSockets, event-driven architecture, and CRDTs (Automerge) for conflict-free, offline-first state synchronization.
- Developed drag-and-drop tile interface with animated snapping, presence indicators, and optimistic UI updates, demonstrating complex frontend state management and multi-user concurrency control.
- Built backend APIs and persistence using Node.js + Express and PostgreSQL, enabling durable storage, automated bill splitting, and multi-tier synchronization.
- Stack: React, TypeScript, Redux, WebSockets, Automerge, Service Workers, PostgreSQL, Node.js
